## Introduction

Dickinson is a text-generation language for generative literature. Each time you run your code, you get back randomly generated text.

## **Installing Dickinson**

```
First, install cabal and GHC. Then:
```

```
cabal install language-dickinson
```

This provides emd, the command-line interface to the Dickinson language.

You may also wish to install manpages for reference information about emd. Manpages are installed at

emd man

### **Editor Integration**

A vim plugin is available.

### **Program Structure**

Dickinson files begin with  $\mbox{\ensuremath{\%}-},$  followed by definitions.

### Example

```
Here is a simple Dickinson program:
```

```
%-
```

Save this as gambling.dck. Then:

```
emd run gambling.dck
```

which will display either heads or tails.

The :oneof construct selects one of its branches with equal probability.

In general, when you emd run code, you'll see the result of evaluating main.

#### Comments

Comments are indicated with a ; at the beginning of the line. Anything to the right of the ; is ignored. So

```
%-
; This returns one of 'heads' or 'tails'
(:def main
  (:oneof
    (| "heads")
    (| "tails")))
```

is perfectly valid code and is functionally the same as the above.

#### Definitions & Names

We can define names and reference them later:

```
%-
(:def gambling
  (:oneof
     (| "heads")
     (| "tails")))
(:def main
     gambling)
```

We can emd run this and it will give the same results as above.

#### Branching

When you use :oneof, Dickinson picks one of the branches with equal probability. If this is not what you want, you can use :branch:

```
%-
(:def unfairCoin
  (:branch
     (| 1.0 "heads")
      (| 1.1 "tails")))
(:def main
    unfairCoin)
```

This will scale things so that picking "tails" is a little more likely.

### Interpolation

We can recombine past definitions via string interpolation:

```
%-
(:def adjective
  (:oneof
    (| "beautiful")
    (| "auspicious")
    (| "cold")))
(:def main
  "What a ${adjective}, ${adjective} day!")
Multi-Line Strings
For large blocks of text, we can use multi-line strings.
(:def twain
  111
  Truth is the most valuable thing we have - so let us economize it.
    - Mark Twain
  ''')
Multiline strings begin and end with '''.
```

#### Expressions

Branches, strings, and interpolations are expressions. A :def can attach an expression to a name.

```
%-
(:def color
   (:oneof
        (| "yellow")
        (| "blue")))

(:def adjective
   (:oneof
        (| "beautiful")
        (| "auspicious")
        (| color)))

(:def main
   "What a ${adjective}, ${adjective} day!")
```

Branches can contain any expression, including names that have been defined previously (such as color in the example above).

#### Lambdas

Lambdas are how we introduce functions in Dickinson.

#### REPL

```
To enter a REPL:
emd repl
This will show a prompt
emd>
If we have
%-
(:def gambling
  (:oneof
    (| "heads")
    (| "tails")))
in a file gambling.dck as above, we can load it with
emd> :1 gambling.dck
We can then evaluate gambling if we like
emd> gambling
or manipulate names that are in scope like so:
emd> "The result of the coin toss is: ${gambling}"
We can also create new definitions:
emd> (:def announcer "RESULT: ${gambling}")
emd> announcer
```

#### Saving & Restoring States

We can save the REPL state, including any definitions we've declared during the session.

```
emd> :save replSt.emdi
If we exit the session we can restore the save definitions with
emd> :r replSt.emdi
emd> announcer
```

For reference information about the Dickinson REPL:

:help

#### Lints

emd has a linter which can make suggestions based on probable mistakes. We can invoke it with emd lint:

```
emd lint silly.dck
```

#### Libraries

Dickinson allows pulling in definitions from other files with :include.

#### Using Libraries

#### Example

```
The color module is bundled by default:

(:include color)

%-

(:def main
   "Today's mood is ${color}")

The :include must come before the %-; definitions come after the %- as above.

color.dck contains:

%-

(:def color
   (:oneof
    (| "aubergine")
    (| "cerulean")
    (| "azure")
```

## Writing Libraries

# Scripting

```
emd ignores any lines staring with #!; put
#!/usr/bin/env emd
and the top of a file to use emd as an interpreter. As an example, here is an implementation of the Unix fortune program as a script:
#!/usr/bin/env emd
%-
(:def adjective
  (:oneof
    (| "good")
        (| "bad")))
(:def main
    "You will have a ${adjective} day")
```

## Examples
